Publication – “Wheat Disease Identification”

There are many different diseases that affect wheat in Ontario caused by various pathogens. Although they occur in all wheat producing areas of the province, the economic impact caused by these diseases varies from year to year depending on environmental conditions. When the environmental conditions favour the development of these pathogens, local losses can be significantly greater. Proper identification is critical to effective disease management and this is especially important in order to maximize profitable fungicide applications for disease control.

This publication was developed in conjunction with the U.S. multi-state extension and research committees for small grain diseases, NCERA-184 and WERA-97. Funding for publication of 4,000 copies of this 24 page colour disease identification guide was made possible through the Grain Farmers of Ontario which obtained funding for the SMART Wheat project (Strategic Management Adding Revenue Today) through Agriculture and Agri-Food Canada’s CanAdvance Program which is administered by the Agricultural Adaptation Council in Guelph.

If you would like a copy of the brochure please call the Ridgetown OMAFRA Resource Centre at 519-674-1690.

Acknowledgements
 This publication was developed by the multi-state extension and research committees for small grain diseases, NCERA-184 and WERA-97. Publication authors: Erick De Wolf, James P. Shroyer, and Brian Olson, Kansas State University. Photo credits: Erick De Wolf, Bill Bockus, James P. Shroyer, and Bill Willis, Kansas State University; Tim Murray, Washington State University; and Marcia McMullen, North Dakota State University. The USDA-NIFA Extension Integrated Pest Management program award 2009-41533-05331 sponsored development and distribution of this publication.
